Summary

Software engineer building data-intensive backend systems in **Java/Spring Boot** and full-stack on **TypeScript/Next.js**, with a **PostgreSQL + AWS** focus. Side projects in workflow engines and agentic **RAG** search (**OpenAI** embeddings, **pgvector**, **LangChain**).

Technical Skills

Languages: Java, Python, TypeScript, JavaScript, SQL, Bash

Frameworks: Spring Boot, React, Next.js (App Router), FastAPI, Express, Node.js, Bun, Prisma, Tailwind, Zod

APIs & Protocols: REST, GraphQL, JWT, OAuth 2.0, WebSockets

Cloud & DevOps: AWS (EC2, Lambda, S3, DynamoDB, API Gateway), Vercel, Neon, Docker, Kubernetes, GitHub Actions, Jenkins, CI/CD

Data & AI/ML: PostgreSQL, MongoDB, Redis, Kafka, pgvector; Claude, OpenAI, LangChain, scikit-learn, Pandas, NumPy

Testing & Mobile: JUnit, Vitest, Playwright, Postman, Capacitor, PWA

Practices & Architecture: Agile/Scrum, Git, Linux, TDD, Microservices, System Design, Distributed Systems

Certifications: AWS Certified Solutions Architect — Associate

Experience

MLGW | Software Engineer | Memphis, TN

Mar 2025 – Present

- Build **Java/Spring Boot** services migrating the document system-of-record (bills, letters, notices; ~500K customers, ~50M+ documents) from **Oracle DB** to **EngageOne Vault** object storage — idempotent writes, versioned retrieval, and **OAuth2/JWT**-secured **REST APIs** with **Redis** read-through caching for internal ops tools and customer self-service.
- Decouple document generation from Vault archival with a **Kafka** consumer pipeline (at-least-once delivery, dedup keyed on document ID, ~2M+ documents/month) so generation no longer blocks on archival latency; deployed as containerized services on **Kubernetes**.
- Develop scheduled **Java** billing engines that compute streetlight charges across **7 Shelby County municipalities** and bill ~2K large-commercial accounts; parallelizing rate calculation to fit the nightly batch window.
- Automate rule-based data-quality checks (**Python**, Pandas, NumPy) and **USPS** address standardization across millions of records each cycle, flagging invalid address changes, duplicate charges, and orphaned readings before they hit statements.

Lumin Inc | Software Development Engineer | Minneapolis, MN

July 2024 – Mar 2025

- Maintained and extended **PACS/DICOM** integration on **Spring Boot** + **dcm4che** + **PixelMed**; sustained ~500 images/min throughput at sub-1.3s p95 via streaming buffers, HTTP/2 connection pooling, and async tile prefetch.
- Designed versioned **REST** contracts for 9 clinical integration endpoints with idempotent PUT semantics; cut p95 retrieval from 320ms → 185ms via a composite index on the (study_uid, patient_id) join path and **Postman** contract suites in CI.
- Wrote **JUnit** + **Mockito** harness with ~85% coverage across the clinical integration layer, simulating **DICOM** payloads and **PACS** endpoints; locked regression behavior and dropped field-reported defects on subsequent releases.

Infor | Software Development Engineer | Hyderabad, India

May 2021 – Jul 2022

- Shipped customer-facing features on a single-tenant **WFM ERP** in **Java**; templated **AWS EC2** environments via AMI bake that cut staging-to-prod deploy time ~20% across client workspaces.
- Built a clock-in/clock-out mobile companion for the **WFM ERP** (**Java** + **AWS Lambda** + **DynamoDB**) used by field workers across multiple client deployments; authored the operations runbook adopted by support engineers.
- Wired **Jenkins** CI/CD pipelines (build + smoke + AMI promotion) for the **WFM ERP** backend; cut release time from ~3h of hands-on work to under 15 min, unblocking the dev team.

Hindustan Times | Software Development Engineer Intern | Delhi, India

Aug 2020 – Dec 2020

- Built a real-time COVID-19 tracker (**Java** + **React** + **MongoDB**) visualizing 100K+ cases for the newsroom; integrated multiple public-health data feeds and shipped reusable **React** chart components to production.

Projects

- **LuminTrack — Internal HR Operations Platform** — *Next.js 16, TypeScript, Prisma, Neon Postgres, Tailwind, Zod, JWT, Recharts, Vercel Blob* — Designed a **9-stage strict-transition state machine** with an event-sourced activity timeline over **WebSockets** behind a full-stack HR-ops workflow engine; added **RAG** document search over uploads (**OpenAI** embeddings + **pgvector** + **LangChain**) and **Google OAuth 2.0** SSO with role-scoped **JWT** sessions (*jose, bcrypt*).
- **EdgeStack — Blackjack Strategy Trainer & Session Analytics** — *Bun, Express, PostgreSQL, Prisma, Zod, JWT, Capacitor* — Versioned **REST API** (/api/v1, 30+ endpoints) with refresh-token rotation, integer-cent money handling, and typed error middleware; sub-second decision scorer across drill modes; packaged for iOS/Android with offline sync.

Education

Master of Science (MS), Computer Science

Aug 2022 – May 2024

Arizona State University, Tempe, Arizona

GPA: 3.7

- **Relevant Coursework:** Distributed Systems, Machine Learning, Cloud Computing, Operating Systems, Algorithms

Bachelor of Technology in Electronics and Communication Engineering

Aug 2017 – May 2021

Birla Institute of Technology and Science (BITS Pilani), India

GPA: 3.5
